EXPERIMENT 9

Aim: Implement Recurrent Neural Network (RNN) / LSTM for time series or text data

1. Dataset Source

Dataset used: **Air Quality Dataset (UCI Repository)**
Link: https://archive.ics.uci.edu/dataset/360/air+quality

2. Dataset Description

The Air Quality dataset contains environmental sensor data collected in an Italian city.

- **Type:** Time Series Data
- **Instances:** ~9,000 records
- **Attributes:** 15 features

Key Features:

- CO(GT): Carbon monoxide concentration (target variable used)
- PT08.S1(CO): Sensor response
- NMHC(GT): Non-methane hydrocarbons
- NOx(GT): Nitrogen oxides
- Temperature (T)
- Relative Humidity (RH)
- Absolute Humidity (AH)

Target Variable

- The experiment uses **CO(GT)** (converted to numeric and cleaned)

Data Characteristics

- Contains missing values represented as **-200**
- Requires preprocessing (cleaning + normalization)
- Sequential/time-dependent → suitable for LSTM

3. Mathematical Formulation of LSTM

LSTM (Long Short-Term Memory) is a type of RNN designed to handle long-term dependencies.

Core Equations:

Forget Gate:

$$f_t = \sigma(W_f \cdot [h_{t-1}, x_t] + b_f)$$

Input Gate:

$$i_t = \sigma(W_i \cdot [h_{t-1}, x_t] + b_i)$$

Candidate Cell State:

$$\tilde{C}_t = \tanh(W_C \cdot [h_{t-1}, x_t] + b_C)$$

Cell State Update:

$$C_t = f_t \cdot C_{t-1} + i_t \cdot \tilde{C}_t$$

Output Gate:

$$o_t = \sigma(W_o \cdot [h_{t-1}, x_t] + b_o)$$

Hidden State:

$$h_t = o_t \cdot \tanh(C_t)$$

Loss Function (Regression)

$$Loss = \frac{1}{N} \sum (y_{true} - y_{pred})^2$$

4. Algorithm Limitations

- Requires **large datasets** for good performance
- Computationally expensive compared to traditional models
- Sensitive to hyperparameters (epochs, learning rate, units)
- Cannot handle **very noisy data** effectively

- Training can be slow on CPU (as seen in your output)
- Risk of overfitting if not properly tuned

5. Methodology / Workflow

Step-by-Step Process

1. **Data Loading**
   - Load CSV file using `readtable()`
2. **Data Cleaning**
   - Convert column to numeric
   - Replace **-200 with NaN**
   - Remove missing values
3. **Normalization**
   - Normalize data for better training
4. **Sequence Creation**
   - Input: XtX_tXt
   - Output: Xt+1X_{t+1}Xt+1
5. **Model Design**
   - Sequence Input Layer
   - LSTM Layer (50 units)
   - Fully Connected Layer
   - Regression Layer
6. **Training**
   - Optimizer: Adam
   - Epochs: 50
7. **Prediction**
   - Predict values using trained model
8. **Visualization**
   - Plot Actual vs Predicted values

6. Performance Analysis

- Training completed for **50 epochs**
- RMSE values fluctuate between **~0.5 to 1.3** (page 3–4 logs)
- Loss reduces gradually → model is learning

Graph Observation:

- Blue = Actual values
- Red = Predicted values
- Predictions follow trend but have slight deviations

Conclusion:

- Model captures **time-series pattern successfully**
- Some error exists due to:
    - Noise in data
    - Simple model architecture

7. Hyperparameter Tuning

Parameters Used:

- LSTM Units = 50
- Epochs = 50
- Optimizer = Adam
- Learning Rate ≈ 0.001

Tuning Strategies

Parameter	Effect
Increase LSTM units	Better learning but more computation
Increase epochs	Improves accuracy but risk of overfitting
Learning rate	Too high → unstable, too low → slow learning
Batch size	Affects convergence speed

Possible Improvements

- Increase LSTM units (e.g., 100)
- Add Dropout layer to prevent overfitting
- Use multiple LSTM layers (Deep LSTM)
- Try Bidirectional LSTM

8. Code and Output

```
% Load dataset
data = readtable('AirQualityUCI.csv');

% Convert column to numeric (IMPORTANT FIX)
series = str2double(data{:,3});

% Replace invalid values (-200)
series(series == -200) = NaN;

% Remove missing values
series = series(~isnan(series));

% Normalize
series = normalize(series);

% Create sequences
X = series(1:end-1);
Y = series(2:end);

XTrain = num2cell(X');
YTrain = num2cell(Y');

% LSTM network
layers = [
   sequenceInputLayer(1)
   lstmLayer(50)
   fullyConnectedLayer(1)
   regressionLayer
];

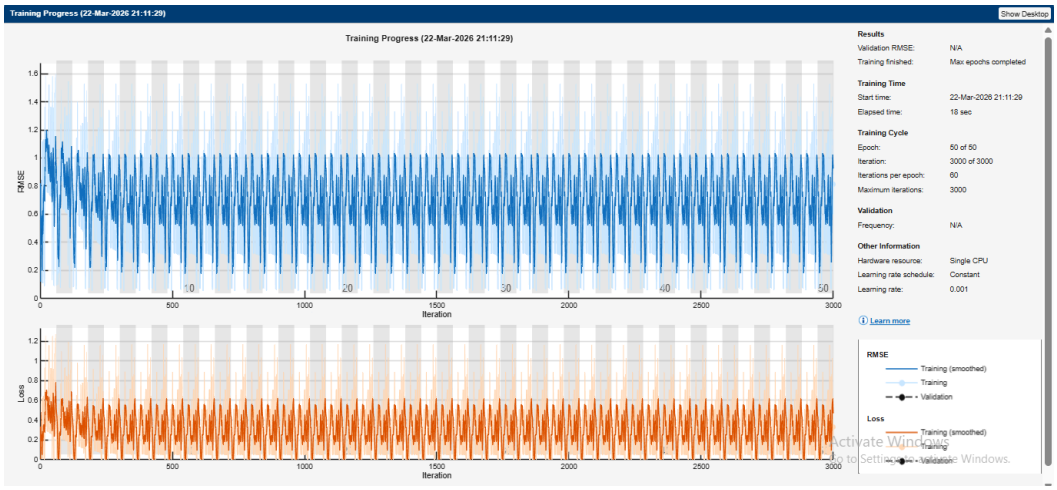
% Training options
options = trainingOptions('adam', ...
   'MaxEpochs', 50, ...
   'Plots','training-progress');
```

```
% Train
net = trainNetwork(XTrain, YTrain, layers, options);

% Predict
YPred = predict(net, XTrain);

YPred = cell2mat(YPred);
YTrue = cell2mat(YTrain);

% Plot results
figure;
plot(YTrue, 'b');
hold on;
plot(YPred, 'r');
legend('Actual','Predicted');
title('LSTM Time Series Prediction');
```



Command Window

```
Training on single CPU.

|      50 |        2950 |       00:00:18 |         0.53 |          0.1 |          0.0010 |
|      50 |        3000 |       00:00:18 |         0.81 |          0.3 |          0.0010 |
|=======================================================================================|
Training finished: Max epochs completed.
```

9. Conclusion

The LSTM model successfully performs time-series forecasting on air quality data. It captures temporal dependencies effectively, though performance can be further improved with better tuning and model complexity.
